

Secure Content Management

Streamline Your Business Processes,
Provide Content Through a Holistic and Secure Platform

Solutions Provided

Solve your content access need without VPN

Solve your content sharing problem over uncontrolled, cloud-based environments. Support HTTP(S)-FTP(S)-SFTP protocols.

Solve access and permission management problems. Define user and group based private access policies.

Solve your access reporting and log problems in all content environments.

Solve the problem of failing to send emails with large attachments and preserve capacity on email servers.

Enable approval flows while sharing files

- **Increase productivity while working remotely**

FileOrbis ensures your users access their content easily even while working remotely.

Working remotely is the new normal. Enterprises should ensure that users access their content easily from everywhere. Most of the file environments are not designed through remote accesses therefore they suffer due to technical limitations. File environments are not listed in digital transformation priority lists and companies could not let users access their content during the pandemic. FileOrbis ensures users access their contents seamlessly and securely and work at the highest productivity level.

- **Reduce security and compliance risks**

Security and compliance risks are unarguable business risks for enterprises and each solution deployed is requested to help reducing security and compliance risks.

Files are the main elements where all kinds of data reside. In order to achieve a high level of security and compliance, enterprises inevitably require control over files full of data and most of the time-sensitive data. Taking into account that files are accessed, used, shared with internal and external users, control on files should be available at any point of the content flow. FileOrbis, as a platform working at every point of content flow, will help enterprises have full control of files and, as a result, reduce any security and compliance risks stemming from lack of control.

- **Eliminate the maintenance cost of dispersed, disconnected file environments**

Most IT infrastructure hosts several solutions for files and these solutions are, most of the time, highly dispersed and not connected to each other.

One of the main problems of IT teams is the administrative load of several independent systems. Every enterprise tries to consolidate these systems as much as possible both to eliminate administration load and to get more efficiency and benefit from highly integrated systems. This situation is not different for file systems; each business unit, each digital business, etc. may have dedicated solutions to use or share files. The most common reason for this is the fact that most solutions concentrate only on achieving one task whereas FileOrbis provides a "platform" that has many capabilities within a single solution from accessing files from mobile apps to sharing the same files via SFTP with 3 parties.

Consolidate all your file environments in a single platform, so ensure a certain standard

Meet your classification needs via automatic and user-driven classification

Eliminate shares with everyone and USBs. Define public workplaces.

Ensure that files are viewed with watermark applied on them.

Ensure that security policies are applied to any file users upload, download or preview on the platform.

Eliminate the permission complexity and unused files on file servers

Support your enterprise while meeting legal and compliance requirements with sensitive data analysis and aging in all file environments.

About FileOrbis

FileOrbis is a product family aiming to manage the user and content relationship within an institutional framework. FileOrbis is constantly being developed to meet the different needs of customers and industries in terms of content management. FileOrbis focuses on high security, wide integration options, ease of use, and granular management.

- **Minimize the cost of software development**

Digital transformations require every business application to be digitalized and reach a certain capability level; enterprises struggle with adapting their software to meet business requirements.

As the primary business element, files are most generated by business applications. Most of the time, these files are needed to share with business partners in every B2B and B2C companies and also with customers in B2C companies. Files fully loaded with sensitive information should be handled with high care and their flow should be controlled all the time. Business applications are designed to achieve a specific task not controlling files most of the time. Therefore, the application should be improved to support file control. This improvement can be highly expensive or either not possible under certain circumstances. FileOrbis, the specialized platform for controlling content flow, will help business applications with its API library and SDKs. The cost of improving software will drastically drop with the help of APIs and SDKs.

WHY FILEORBIS?

- **Customer and business outcome-focused**

FileOrbis is actively seeking ways of helping users and businesses ensuring during digital transformation. To help better, FileOrbis always listens to the customers and tries to understand their needs as a primary responsibility to their existing and potential customers. As a result of this effort; more than %60 of our customers either increase their existing licenses or add new add-ons.

- **High experience in different sectors**

FileOrbis bring extensive control on content flow. Today, almost every enterprise from different sectors needs to work with different types of data from financial to health data. Therefore, every enterprise needs a certain level of control on all the data they work on and, more importantly, on the data they share with 3 parties.

- **Fast time to value**

FileOrbis can be up-and-running within days; you don't need to spend time and effort for a long time to get an outcome. To get an outcome from most of the digital transformation projects, you may need to spend a huge effort for a long time.

- **Single platform meeting all file management and share needs**

It is very common for enterprises to have different solutions for different needs, even for different business units. This stems from the fact that most of the solutions concentrate on a part of content flow. FileOrbis handles content flow as a whole and provides all of the components needs at different stages of content flow.

- **Extensive integration options**

Integration both brings operational efficiency and helps enterprises to get more than what solutions can provide when they stay standalone. The importance of such integration is very well taken by FileOrbis and at every stage of software development and software deployments at customers, integration opportunities are eagerly sought.

- **Agile solution**

FileOrbis is developed on the most commonly used and capable software development environments mostly based on micro-services. This structure makes FileOrbis highly agile and adaptable. Using API services ensures high integration capabilities and ease of support for new technologies within FileOrbis.
